

PRODUCT NEWS - *EZ00* - Small Scale (Z & N) Steam & Diesel Locomotives

Bright constant-intensity headlights for N Scale steam locomotives and Z Scale diesels are available from Richmond Controls. Examples in N Scale include the Atlas Shay, Model Power 4-4-0, and Micro-Ace/Atlas Mogul. Examples in Z Scale include many of the diesels made by AZL. A special version of the EZ00 module is available for each of these locomotives, and the module is made to fit the specific locomotive.

In the N Scale steam locomotives, generally a Golden White surface mount LED can be inserted directly into the headlight fixture. The EZ00 module is then located in some convenient location on the locomotive.

In Z Scale diesels, it generally has worked best to mount a dual Golden White surface mount LED behind the headlight holes. The EZ00 module can then usually be located at the other end of the locomotive.

Prices vary according to how many LEDs are supplied and how many directions of operation are desired. Typically, prices range between \$24.00 for the simplest modules and \$40.00 for the most complex modules. All modules are made to order, and are generally not in stock for rapid shipment.

We **STRONGLY** recommend using Pacer's Formula 560 Canopy Glue to secure these LEDs in position. If your local retailer doesn't carry this ZAP product, Richmond Controls is usually prepared to furnish single bottles for \$5.00 each.
